In the Claims

1. (currently amended) A method of forming a dielectric layer comprising: providing a substrate comprising a silicon-containing surface;

forming a first metal-containing dielectric layer over the surface, <u>all</u> the metal of the first dielectric layer consisting of at least one element selected from Group IVB of the periodic table; and

forming a second metal-containing dielectric layer on <u>and in contact with</u> the first metal-containing dielectric layer, <u>all</u> the metal of the second dielectric layer consisting of at least one element selected from Group IIIB of the periodic table.

- 2. (previously amended) The method of Claim 1, wherein the metal of the first metal-containing dielectric layer consists of hafnium.
- 3. (currently amended) The method of Claim 1, further comprising: forming a layer of silicon dioxide overlying at least one portion of the surface; and, wherein forming the first metal-containing dielectric layer comprises;
 forming a metal layer over the layer of silicon dioxide; and

combining metal of the metal layer with oxygen of the silicon dioxide layer to form a metal oxide dielectric material.

4. (previously amended) The method of Claim 3, wherein the metal layer comprises hafnium.

- (original) The method of Claim 4, wherein the combining comprises
 providing conditions effective for the hafnium of the metal layer to chemically reduce the silicon dioxide layer.
- 6. (previously amended) The method of Claim 1, where the metal of the second metal-containing dielectric layer consists of one element selected from Group IIIB of the periodic table.
- 7. (previously amended) The method of Claim 1, where the metal of the second metal-containing dielectric layer consists of lanthanum.
- 8. (previously amended) The method of Claim 1, where the forming of the first metal-containing dielectric layer and the forming of second metal-containing dielectric layer comprise:

forming a hafnium-containing layer;

forming a lanthanum-containing layer over the hafnium-containing layer; and exposing the hafnium-containing layer and the lanthanum-containing layer to an oxygen comprising atmosphere and heating the hafnium-containing layer and the lanthanum-containing layer to a temperature effective to form a hafnium-containing dielectric layer and a lanthanum-containing dielectric layer.

- 9. (original) The method of Claim 8, where forming the hafnium-containing layer and the lanthanum-containing layer comprises physical vapor deposition.
- 10. (previously amended) The method of Claim 8, where the exposing comprises ion bombardment of the first hafnium-containing layer and the lanthanum-containing layer using an ion bombardment energy of about 10 electron volts (eV) or less.
- 11. (original) The method of Claim 10 where the heating comprises heating to a temperature from about 200°C to about 400 C during the ion bombardment.
- 12. (original) The method of Claim 8, where the exposing comprises positioning the substrate within a reaction chamber and exposing the hafnium-containing layer and the lanthanum-containing layer to oxygen radicals within the reaction chamber.
 - 13. (original) The method of Claim 8, where:

the forming the hafnium-containing dielectric layer comprises depositing hafnium to a thickness less than or equal to about 5 nanometer (nm); and

the forming the lanthanum-containing dielectric layer comprises depositing lanthanum to a thickness less than or equal to about 5 nm.

- 14. (original) The method of Claim 13 comprising a ratio of the hafnium thickness to the lanthanum thickness of from about 1 to 3 to about 1 to 4.
 - 15. (original) The method of Claim 8, where;

the forming the hafnium-containing dielectric layer comprises forming a layer containing hafnium to a thickness of about 1 nm;

the forming the lanthanum-containing dielectric layer comprises forming a layer containing lanthanum to a thickness no greater than about 5 nm; and

wherein a ratio of thicknesses of the hafnium-containing layer to the lanthanum-containing layer is from about 1 to 3 to about 1 to 4.

- 16. (original) The method of Claim 1, where the forming of the first and second metal-containing dielectric layers comprises physical vapor deposition.
- 17. (original) The method of Claim 16, where physical vapor deposition comprises electron beam evaporation.
- 18. (original) The method of Claim 1, where forming the first metal-containing dielectric layer and the second metal-containing dielectric layer comprises forming the layers to have respective thicknesses having a ratio of from about 4:1 to about 1:4.

- 19. (original) The method of Claim 1, where the first metal-containing dielectric layer consists of hafnium oxide and the second metal-containing dielectric layer consists of lanthanum oxide.
- 20. (currently amended) A method for forming a MOS transistor, comprising: providing a semiconductor substrate having a surface comprising silicon; forming a hafnium-containing dielectric layer overlying the surface, such forming comprising initially forming a hafnium-containing metal layer;

forming a lanthanum-containing dielectric layer on <u>and in contact with</u> the hafnium-containing dielectric layer, <u>such forming comprising initially forming a lanthanum-containing metal layer</u>; and

forming a gate electrode over the hafnium-containing and lanthanum-containing dielectric layers.

21. (currently amended) The method of Claim 20, where:

the forming of the hafnium-containing dielectric layer dielectric layer comprises first forming a hafnium-containing layer;

the forming of the lanthanum-containing dielectric layer comprises second forming a lanthanum-containing layer; and

wherein the first forming and the second forming encompass the forming the hafnium-containing metal layer and the forming the lanthanum-containing metal layer both comprise physical vapor deposition.

- 22. (previously amended) The method of Claim 21, where physical vapor deposition comprises electron beam evaporation.
- 23. (original) The method of Claim 20, further comprising forming a layer of silicon dioxide over at least a portion of the surface comprising silicon, prior to the forming of the hafnium-containing dielectric layer.
- 24. (currently amended) The method of Claim 20, where the forming of the hafnium-containing dielectric layer and the <u>forming the</u> lanthanum-containing dielectric layer <u>further comprises</u>:

first forming a hafnium-containing layer and second forming a lanthanum-containing layer over the substrate; and

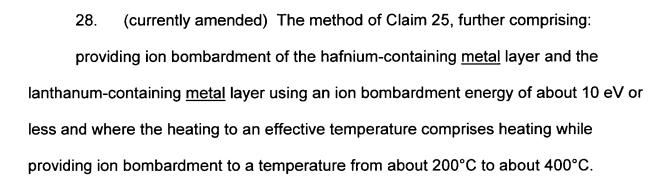

<u>comprise</u> exposing the hafnium- and lanthanum-containing <u>metal</u> layers to an oxygen comprising atmosphere while heating the <u>hafnium and lanthanum metal</u> layers to a temperature effective to form a hafnium-containing dielectric layer and a lanthanum-containing dielectric layer.

25. (original) The method of Claim 24, where forming the hafnium-containing dielectric layer and the lanthanum-containing dielectric layer comprise forming oxides of hafnium and lanthanum, respectively.

- 26. (currently amended) The method of Claim 24, where the heating comprises heating the hafnium_ and lanthanum_containing metal layers to a temperature from about 200°C to about 400°C.
- 27. (currently amended) The method of Claim 25, where:

 the hafnium-containing metal layer is formed over a layer of silicon dioxide; and
 further comprising providing conditions effective for the hafnium-containing metal
 layer to chemically reduce the layer of silicon dioxide.

29. (currently amended) The method of Claim 25, where:

the forming of the hafnium-containing metal layer comprises forming such layer having a thickness no greater than about 5 nanometers;

the forming of the lanthanum-containing <u>metal</u> layer comprises forming such layer having a thickness no greater than about 5 nanometers; and

wherein a ratio and a sum of the thicknesses of the hafnium-containing metal layer to the lanthanum-containing metal layer is from about 1 to 4 to about 4 to 1 and no greater than about 6 nm, respectively.

- 30. (currently amended) The method of Claim 29 where the thickness of the hafnium-containing metal layer is no greater than about 1 nm.
- 31. (currently amended) The method of Claim 29 where the hafnium-containing dielectric layer and the lanthanum-containing dielectric layer are collectively a gate dielectric layer, where the gate dielectric layer is formed having an equivalent oxide thickness less than or equal to 2 nm.

Claims 32-51 (cancelled)

52. (currently amended) A method of forming a dielectric layer comprising: providing a substrate comprising a silicon-containing surface;

forming a first metal-containing dielectric layer over the surface, the metal of the first layer consisting essentially of hafnium; and

forming a second metal-containing dielectric layer on <u>and in contact with</u> the first metal-containing dielectric layer, the metal of the second layer consisting essentially of lanthanum.

Claim 53 (cancelled)

54. (currently amended) A method for forming an <u>a</u> MOS transistor, comprising:

providing a semiconductor substrate having a surface comprising silicon;
forming a dielectric layer consisting of hafnium oxide overlying the surface;
forming a dielectric layer consisting of lanthanum oxide on <u>and in contact with</u>
the hafnium oxide dielectric layer; and

forming a gate electrode over the hafnium oxide and lanthanum oxide dielectric layers.

55. (currently amended) A method for forming an \underline{a} MOS transistor, comprising:

providing a semiconductor substrate having a surface comprising silicon;
forming a hafnium-containing layer overlying the surface;
oxidizing the hafnium-containing layer into a hafnium-containing dielectric layer;
forming a lanthanum-containing dielectric layer on and in contact with the
hafnium-containing dielectric layer; and

forming a gate electrode over the hafnium-containing and lanthanum-containing dielectric layers.

56. (previously re-presented) A method of forming a dielectric layer comprising:

providing a substrate comprising a silicon-containing surface;
forming a layer of silicon dioxide overlying at least one portion of the surface;
forming a hafnium-containing layer over the layer of silicon dioxide;
combining hafnium of the hafnium-containing layer with oxygen of the silicon
dioxide layer to form a hafnium oxide over the surface;

forming a lanthanum-containing layer over the hafnium-containing layer; and exposing the hafnium-containing layer and the lanthanum-containing layer to an oxygen comprising atmosphere by ion bombardment using an energy of about 10 electron volts (eV) or less, and heating the hafnium-containing layer and the lanthanum-containing layer to a temperature effective to form a hafnium-containing dielectric layer and a lanthanum-containing dielectric layer.

57. (previously re-presented) The method of Claim 56 where the heating comprises heating to a temperature from about 200 C to about 400 C during the ion bombardment.

58. (previously re-presented) A method of forming a dielectric layer comprising:

providing a substrate comprising a silicon-containing surface;
forming a layer of silicon dioxide overlying at least one portion of the surface;
forming a hafnium-containing layer over the layer of silicon dioxide;
combining hafnium of the hafnium-containing layer with oxygen of the silicon
dioxide layer to form a hafnium oxide over the surface;

forming a lanthanum-containing layer over the hafnium-containing layer; and positioning the substrate within a reaction chamber and exposing the hafnium-containing layer and the lanthanum-containing layer to oxygen radicals within the reaction chamber and heating the hafnium-containing layer and the lanthanum-containing layer to a temperature effective to form a hafnium-containing dielectric layer and a lanthanum-containing dielectric layer.

59. (previously re-presented) A method for forming a MOS transistor, comprising:

providing a semiconductor substrate having a surface comprising silicon; first forming a hafnium-containing layer and second forming a lanthanum-containing layer over the substrate, the first forming and the second forming encompassing physical vapor deposition;

exposing the hafnium and lanthanum containing layers to an oxygen comprising atmosphere by ion bombardment of the hafnium-containing layer and the lanthanum-containing layer using an energy of about 10 eV or less while heating the hafnium and lanthanum layers to a temperature from about 200 C to about 400 C to form oxides of hafnium and lanthanum as a hafnium-containing dielectric layer and a lanthanum-containing dielectric layer, respectively; and

forming a gate electrode over the hafnium-containing and lanthanum-containing dielectric layers.
